Dynamical regimes of strongly correlated electrons under periodic driving

Francesco Peronaci (Institut de Physique Theorique CEA Paris)

Host: Maksym Serbyn

Periodically driven (Floquet) quantum systems may host interesting phenomena, such as topological phases of ultra-cold atoms [1] and light-induced superconductivity [2]. These systems are a long-standing subject of theoretical studies, which recently focused on isolated quantum many-body systems [3]. In the seminar I will discuss recent results [4] on the periodically driven Fermi-Hubbard model a prototype of strongly correlated electrons. First, I will show that for moderate interaction the system thermalizes, as expected for generic isolated many-body systems. Then, I will describe the emergence of a prethermal regime (Floquet prethermalization) as the interaction is increased. This regime is a consequence of a well-known bottleneck mechanism, that is the quasi-conservation of doublon excitations at large interaction. Finally, I will discuss the existence of a critical drive frequency at which the system thermalizes despite the large interaction, due to a resonant condition of the drive frequency with the doublon excitation energy. Tuesday, March 6, 2018 11:00am - 12:30pm

IST Austria Campus Big Seminar room Ground floor / Office Bldg West (I21.EG.101)

This invitation is valid as a ticket for the IST Shuttle from and to Heiligenstadt Station. Please find a schedule of the IST Shuttle on our webpage: http://ist.ac.at/fileadmin/user_upload/pdfs/IST_shuttle_bus.pdf The IST Shuttle bus is marked IST Shuttle (#142) and has the Institute Logo printed on the side.
