Hybrid quantum systems based on collective excitations in solid

Yasunobu Nakamura

University of Tokyo

Host: Johannes Fink

Superconducting qubits have proven to be an excellent tool for quantum state control and measurement in the microwave domain. We construct hybrid quantum systems combining superconducting quantum circuits and other collective excitations in solid-state devices. The examples include photons in microwave resonators and transmission lines [1], magnons in ferromagnetic crystals [2] and phonons in surface acoustic wave resonators [3]. The nonlinearity of superconducting qubits allows manipulation and readout of those excitations in the quantum limit. Such hybrid systems could be used as quantum transducers between different quantum information media.[1] S. Kono et al. Nature Phys. 14, 546 (2018).[2] D. Lachance-Quirion et al. Sci. Adv. 3, e1603150 (2017).[3] A. Noguchi et al. Phys. Rev. Lett. 119, 180505 (2017).[4] A. Noguchi et al. arXiv:1808.03372.

Monday, October 1, 2018 02:00pm - 03:00pm

Big Seminar room Ground floor / Office Bldg West (I21.EG.101)

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.

Please find a schedule of the ISTA Shuttle on our webpage:

<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
