Kazhdan groups have cost 1

Gábor Pete

Hungarian Academy of Sciences & Budapest University of Technology and Economics

Host: M. Beiglböck, N. Berestycki, L. Erdős, J. Maas

A probabilistic definition of groups with Kazhdan's property (T), due to Glasner & Weiss (1997), is that on any Cayley graph G of the group, for any ergodic group-invariant random black-and-white colouring of the vertices, with the density of each colour bounded away from 0, the density of edges connecting black to white vertices remains bounded away from zero. Amenable groups and free groups do not have property (T), while $SL_d(\mathbb{Z})$ with $d \geq 3$ do. The cost of a transitive graph is one half of the infimum of the expected degree of invariant connected spanning subgraphs. Amenable transitive graphs and Cayley graphs of $SL_d(\mathbb{Z})$ with $d \geq 3$ have cost 1, while any Cayley graph of the free group on d generators has cost d , by Gaboriau (2000). A question of Gaboriau aims to connect cost with the first L^2 -Betti number of groups. For Kazhdan groups, the latter has been known to be 0 since Bekka & Valette (1997), and Gaboriau's question then suggests that the cost of any Kazhdan Cayley graph should be 1. This is what we prove, in joint work with Tom Hutchcroft (Cambridge).

Tuesday, November 12, 2019 04:30pm - 05:30pm

SR 14, 2 OG., OMP 1, University of Vienna

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.

Please find a schedule of the ISTA Shuttle on our webpage:

<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
