# Discrete-to-continuum limits of edge dislocations in 2D

**Patrick van Meurs (Kanazawa University, Japan)**

**Host: Jan Maas**

The starting point is a 2D model for the dynamics of  $n$  dislocations, which are modelled as point particles with a positive or negative 'charge'. In the celebrated engineering paper by Groma and Balogh in 1999, the limit passage  $n \rightarrow \infty$  of these dislocation dynamics is performed in a statistical mechanics framework, which relies on a phenomenological closure assumption. In my talk, I present how to pass rigorously to the limit  $n \rightarrow \infty$  by using the theory of Wasserstein gradient flows and using advanced functional analysis on the weak form of the evolution equation. Interestingly, our conclusion for the limiting dynamics of the dislocation density *differs* from the conclusion in the paper by Groma and Balogh.

**Thursday, March 2, 2017 04:00pm - 06:00pm**

IST Austria Campus Seminar room Big Ground floor / Office Bldg West (I21.EG.101)

This invitation is valid as a ticket for the IST Shuttle from and to Heiligenstadt Station. Please find a schedule of the IST Shuttle on our webpage: <https://ist.ac.at/en/campus/how-to-get-here/> The IST Shuttle bus is marked IST Shuttle (#142) and has the Institute Logo printed on the side.
