Sparse expanders have negative curvature

Justin Salez (Université Paris Dauphine)

Host: M. Beiglböck, N. Berestycki, L. Erdős, J. Maas, F. Toninelli

We prove that bounded-degree expanders with non-negative Ollivier-Ricci curvature do not exist, thereby solving a long-standing open problem suggested by Naor and Milman and publicized by Ollivier (2010). In fact, this remains true even if we allow for a vanishing proportion of large degrees, large eigenvalues, and negatively-curved edges. To establish this, we work directly at the level of Benjamini-Schramm limits, and exploit the entropic characterization of the Liouville property on stationary random graphs to show that non-negative curvature and spectral expansion are incompatible "at infinity". We then transfer this result to finite graphs via local weak convergence. The same approach applies to the Bakry-Émery curvature condition $CD(0, \infty)$, thereby settling a recent conjecture of Cushing, Liu and Peyerimhoff (2019).

Tuesday, April 13, 2021 04:30pm - 05:15pm

IST Austria Campus Online via Zoom

This invitation is valid as a ticket for the IST Shuttle from and to Heiligenstadt Station. Please find a schedule of the IST Shuttle on our webpage: <https://ist.ac.at/en/campus/how-to-get-here/> The IST Shuttle bus is marked IST Shuttle (#142) and has the Institute Logo printed on the side.
