How to evolve to resolve a sexual conflict over body size

Elina Immonen (Uppsala University)

Host: Beatriz Vicoso

Males and females commonly show pronounced differences in a range of phenotypes, including form, behaviour and physiology. Yet, the mostly shared genome constrains independent evolution in the sexes, generating sexual conflict. The male-limited Y chromosome should be important for mitigating sexual conflict by accumulating sexually antagonistic loci that only benefit males, but the adaptive potential of Y chromosomes is limited by the loss of recombination between the sex chromosomes. We have investigated how sexual body size dimorphism can evolve in a seed beetle *Callosobruchus maculatus*, and what is the role of sex chromosomes, using a combination of artificial selection, quantitative genetics and long-read sequencing. In this seminar I will show how different forms of sex-specific selection affect the evolutionary potential of size dimorphism, and present our recent findings characterizing genetic variation in the Y chromosome associated with size dimorphism.

Wednesday, June 1, 2022 12:30pm - 01:30pm

ISTA Campus I22 Lakeside View (I22.O1.006)

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station. Please find a schedule of the ISTA Shuttle on our webpage: <https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
