

DynamIST

On projective billiards with open sets of periodic orbits

Corentin Fierobe

Institute of Science and Technology Austria (ISTA)

Host: Kaloshin Group

A billiard is a bounded domain in which we study the trajectory of a ray of light obtained after successive reflections on the boundary of the domain viewed as a perfectly reflecting mirror. Reflections are given by the classical law of optics: angle of incidence = angle of reflection. These dynamical systems are intensively studied, and many interesting questions arise. Ivriis conjecture is one of them: it states that given a billiard in a Euclidean space, the set of its periodic orbits has zero measure. During this talk, we will present another type of billiards introduced by S. Tabachnikov called projective billiards, which generalizes different types of billiards, and show how they can be useful to understand questions related to usual billiards like lvriis conjecture.

Monday, March 28, 2022 03:30pm - 04:30pm

Mondi Seminar Room 2, Central Building

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station. Please find a schedule of the ISTA Shuttle on our webpage: https://ista.ac.at/en/campus/how-to-get-here/ The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
