

## Physical Sciences Seminar

# Chiral Quantum Optics

**Arno Rauschenbeutel**

Vienna Center for Quantum Science and Technology, TU Wien

Host: Johannes Fink

Controlling the interaction of light and matter is the basis for diverse applications ranging from light technology to quantum information processing. Nowadays, many of these applications are based on nanophotonic structures. It turns out that the confinement of light in such nanostructures imposes an inherent link between its local polarization and its propagation direction, also referred to as spin momentum locking of light [K. Y. Bliokh, F. J. Rodríguez-Fortuño, F. Nori, and A. V. Zayats, 2015]. Remarkably, this leads to chiral, i.e., propagation direction-dependent effects in the emission and absorption of light, and elementary processes of light-matter interaction are fundamentally altered. For example, when coupling plasmonic particles or atoms to evanescent fields, the intrinsic mirror symmetry of the particles' emission can be broken. In our group, we observed this effect in the interaction between single rubidium atoms and the evanescent part of a light field that is confined by continuous total internal reflection in a whispering-gallery-mode microresonator [C. Junge, D. O'Shea, J. Volz, and A. Rauschenbeutel, 2013]. In the following, this allowed us to realize chiral nanophotonic interfaces in which the emission direction of light into the structure is controlled by the polarization of the excitation light [J. Petersen, J. Volz, and A. Rauschenbeutel, 2014] or by the internal quantum state of the emitter [R. Mitsch, C. Sayrin, B. Albrecht, P. Schneeweiss, and A. Rauschenbeutel, 2014], respectively. Moreover, we employed this chiral interaction to demonstrate an integrated optical isolator [C. Sayrin, C. Junge, R. Mitsch, B. Albrecht, D. O'Shea, P. Schneeweiss, J. Volz, and A. Rauschenbeutel, 2015] as well as an integrated optical circulator [M. Scheucher, A. Hilico, E. Will, J. Volz, and A. Rauschenbeutel, 2016] which operate at the single-photon level and which exhibit low loss. The latter are the first two examples of a new class of nonreciprocal nanophotonic devices which exploit the chiral interaction between single quantum emitters and transversally confined photons.

**Thursday, June 29, 2017 11:30am - 12:30pm**

Meeting room Ground floor / Office Bldg West (I21.EG.127)

---

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.  
Please find a schedule of the ISTA Shuttle on our webpage:  
<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle  
(#142) and has the Institute Logo printed on the side.
